TETE

Use of automation and simulation in large/commercial engine and application development

Göteborg, 19.11.2014, Dr. S.C.Fritz

Today‘s agenda

Demands of the exhaust gas legislation

Methodology - Which infrastructure is required?

Introduction of DoE and CAMEO

Use and improvement of CAMEO

Examples & Results

Summary!

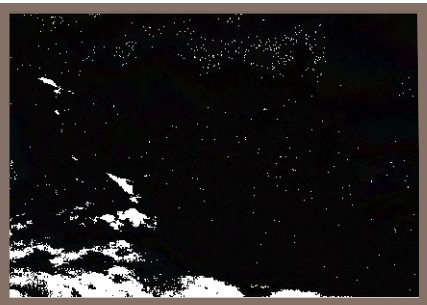
Demands of the exhaust gas legislation
High speed Diesel engines from 75kW to 10.000kW

Propulsion & Power Generation

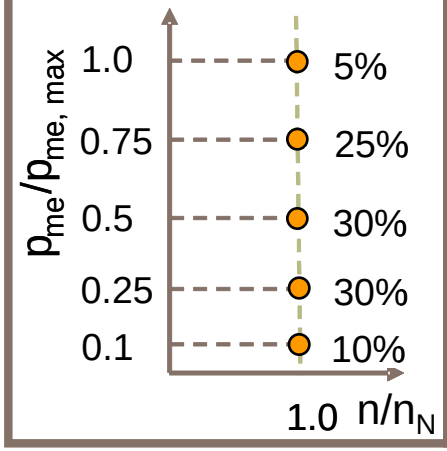
Marine & Offshore		Governmental	C&I, Agriculture Underground Mining	Rail, Mining, Oil & Gas	Power Generation
					
					
					
					

Demands of the exhaust gas legislation
Stationary emission cycles

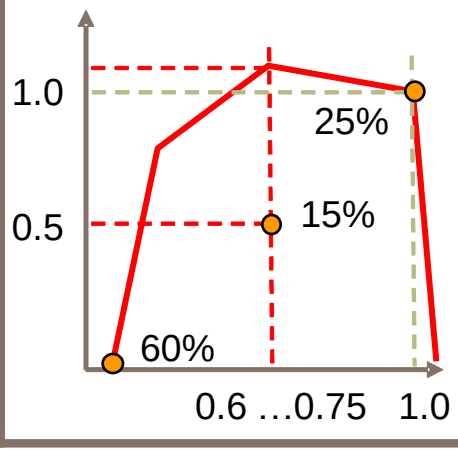
Power Gen	Rail	Const. & Industr.	Agriculture



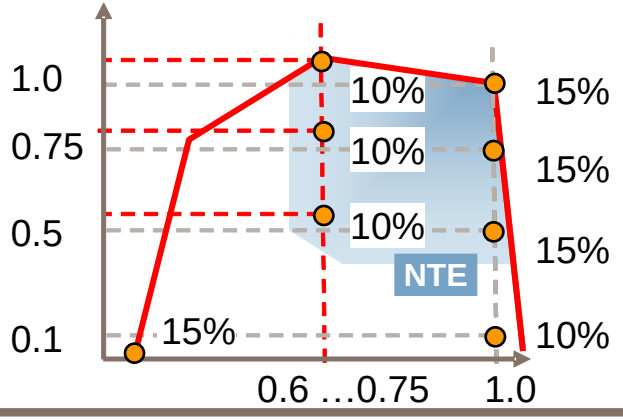
ISO 8178-4 D2- cycle



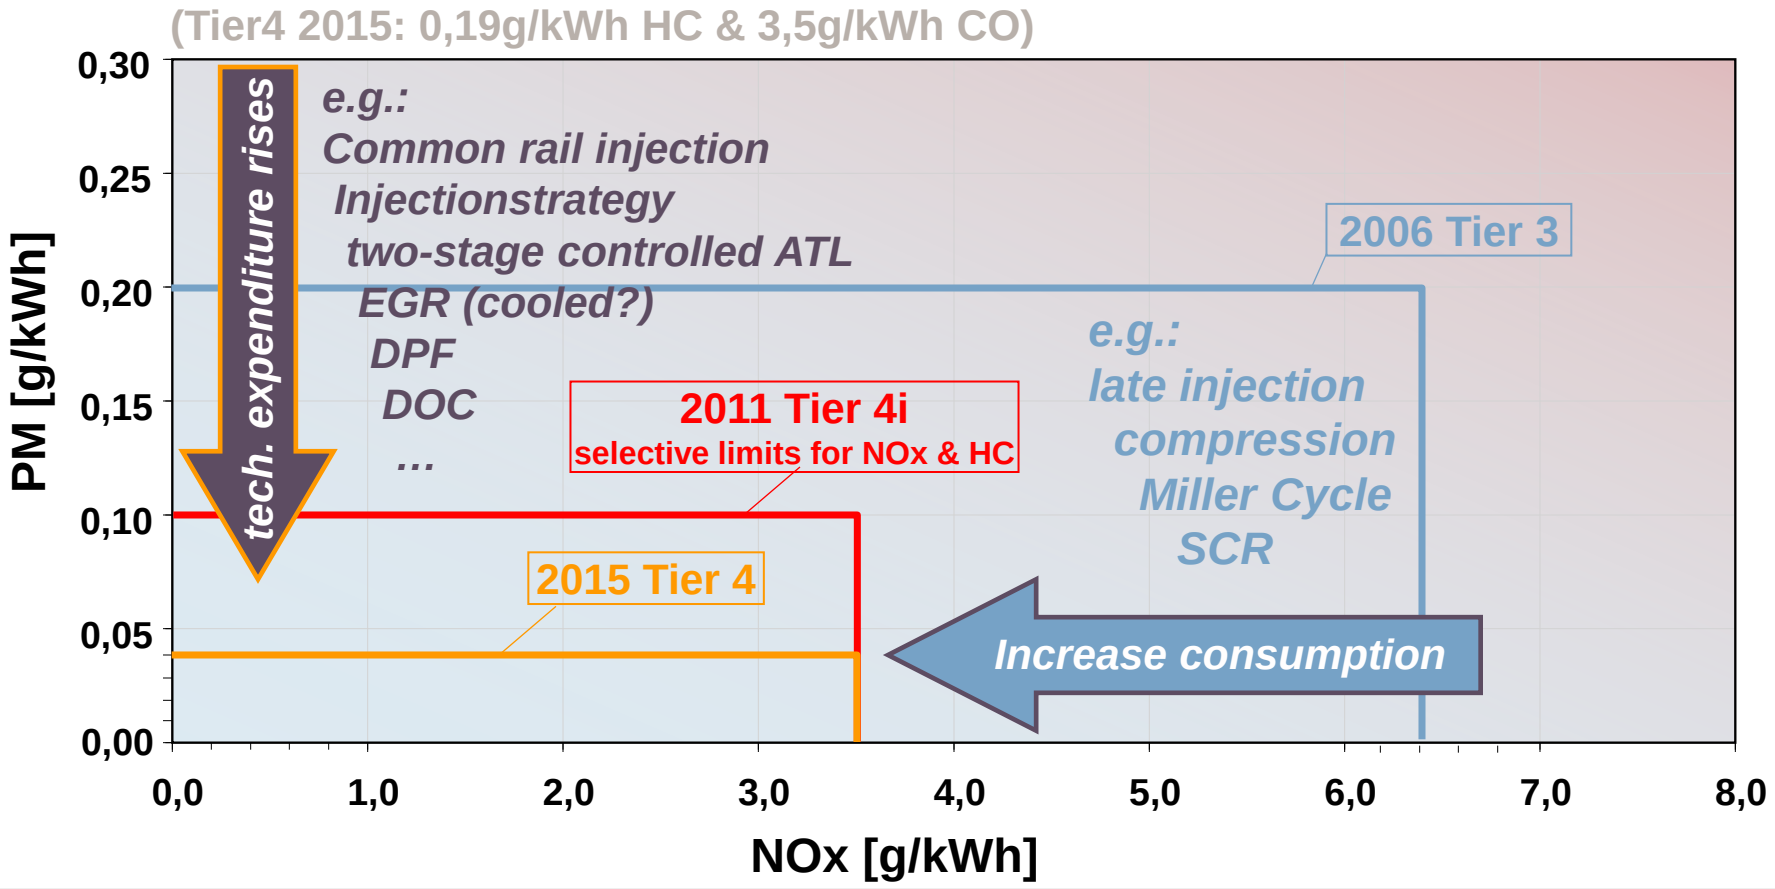
ISO 8178-4 F- cycle



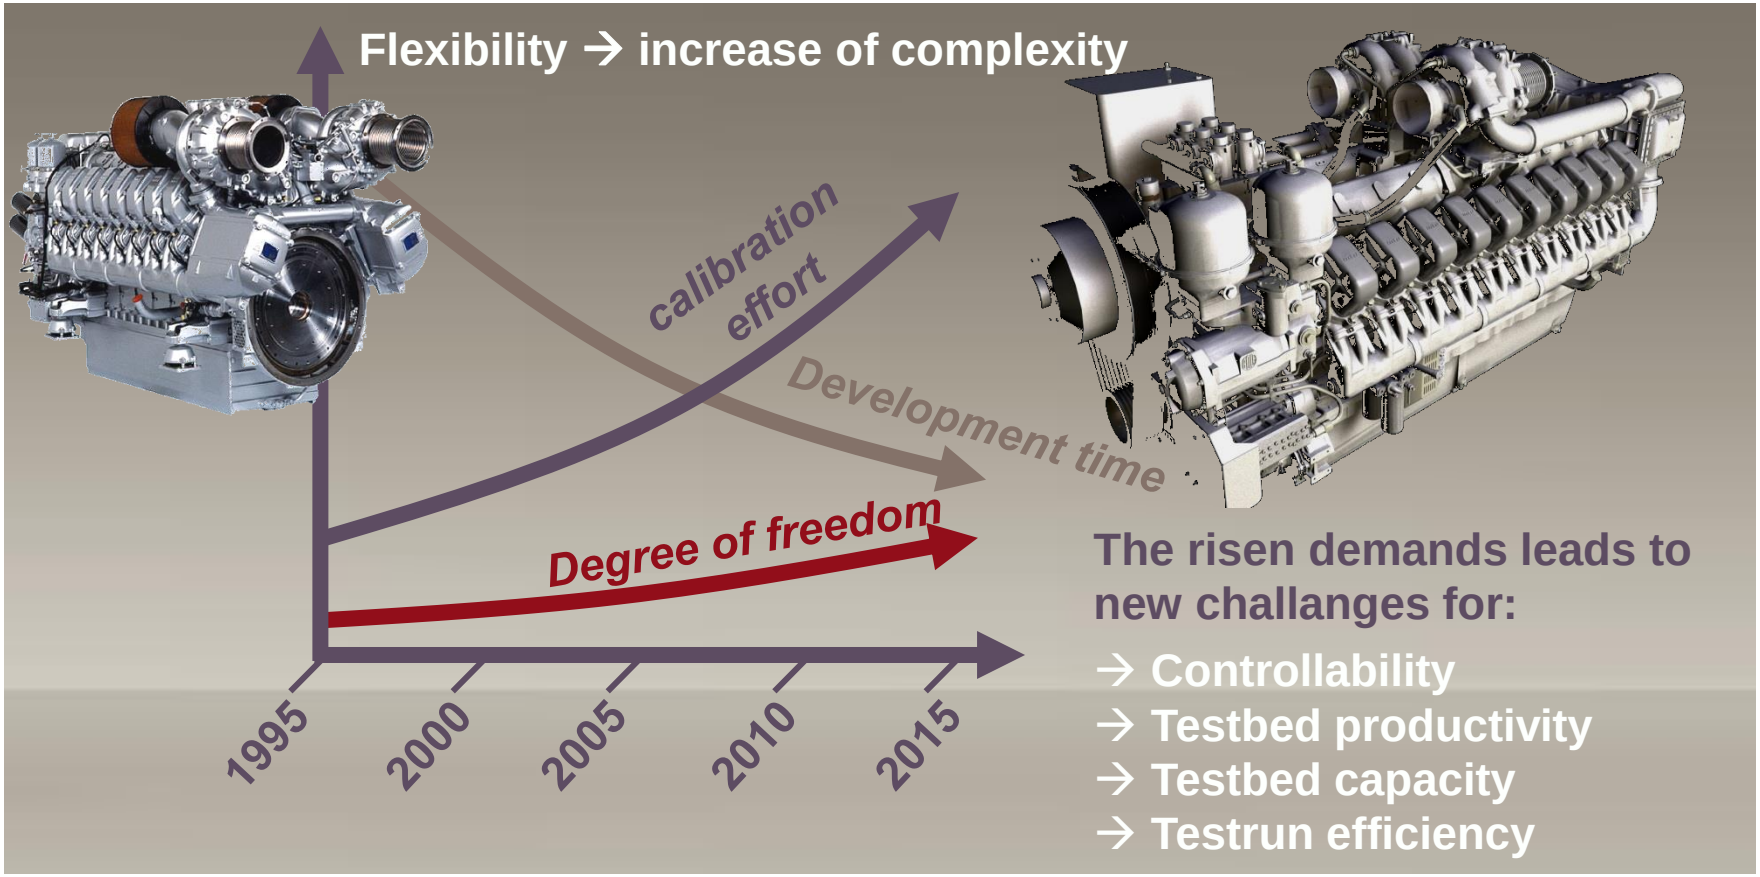
ISO 8178-4 C1- cycle (& NRTC <560kW)



US EPA-emission standards
for achievement >560kW mobile applications (C&I)



Consequence of the exhaust gas legislation
→ Application of Methodology!

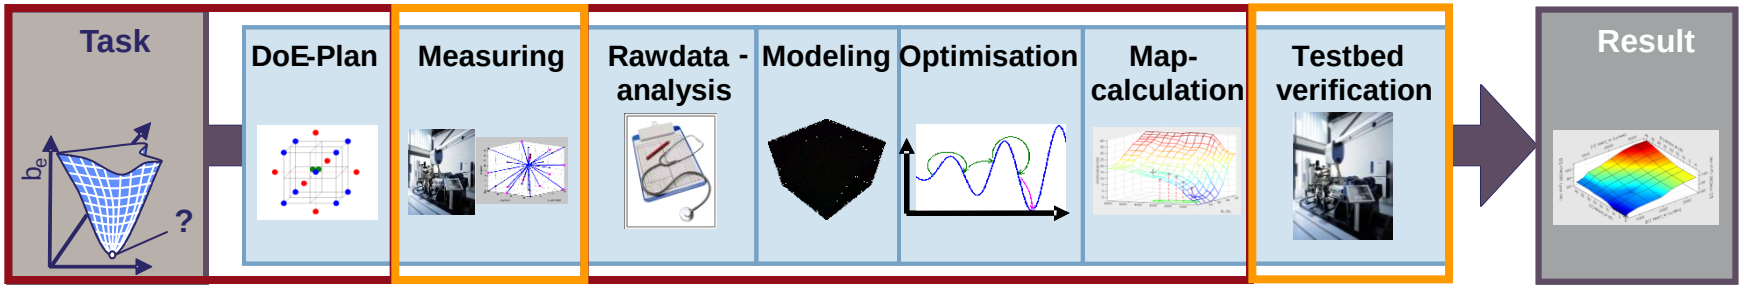


The risen demands leads to new challanges for:

- → Controllability
- → Testbed productivity
- → Testbed capacity
- → Testrun efficiency

Methodology
Which infrastructure is required?

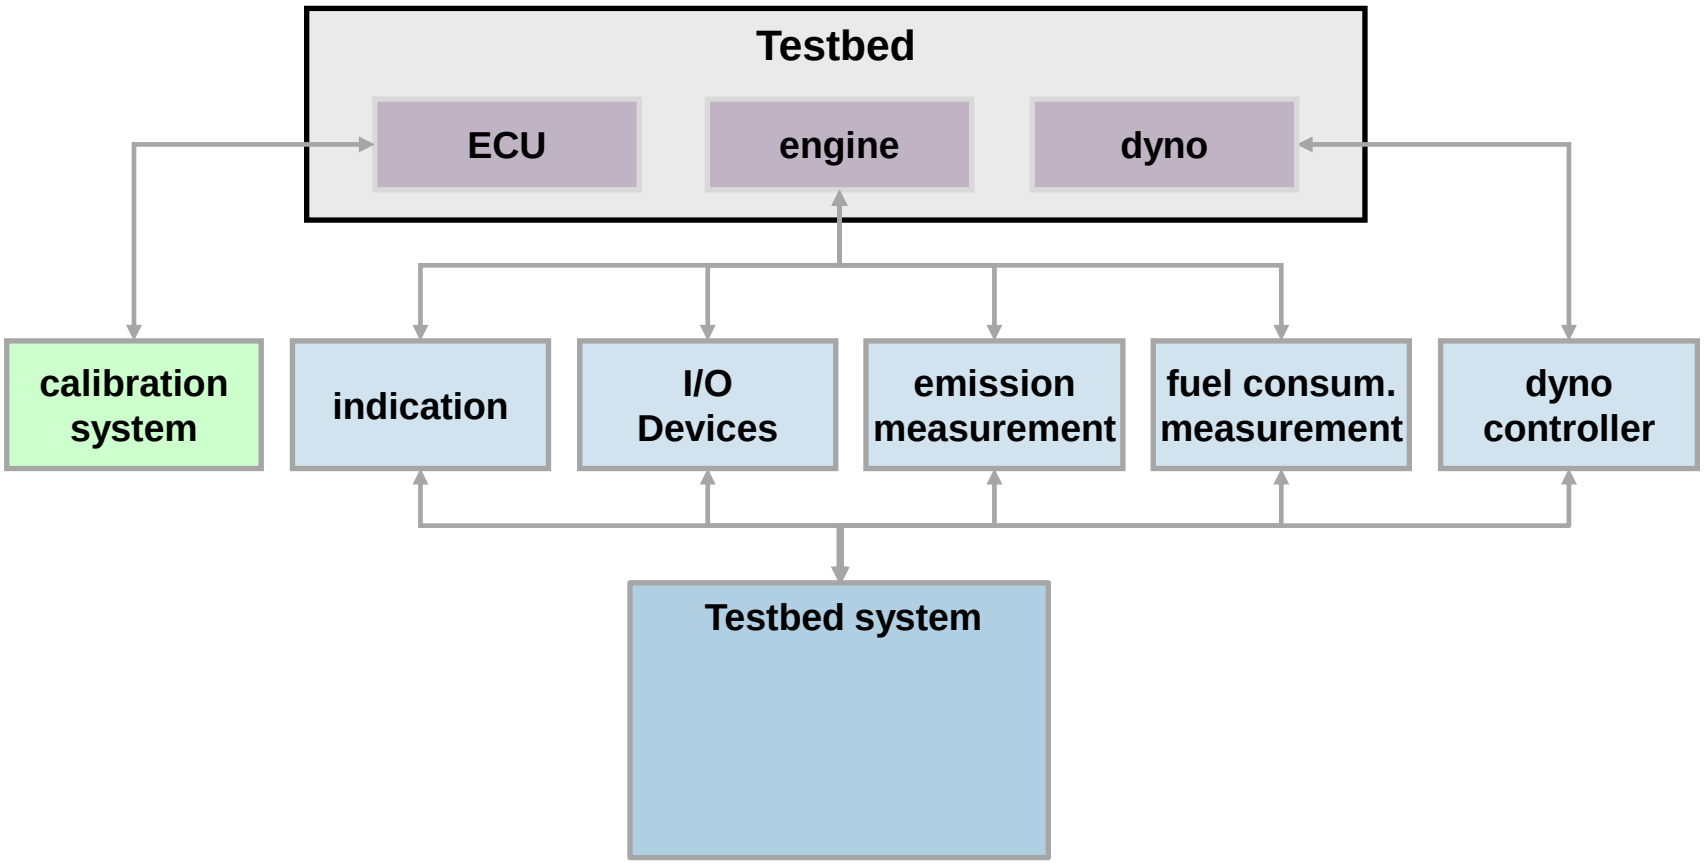
For the coping of future application duties design of experiment (DoE) is introduced to MTU since 2008 toward the following workflow.



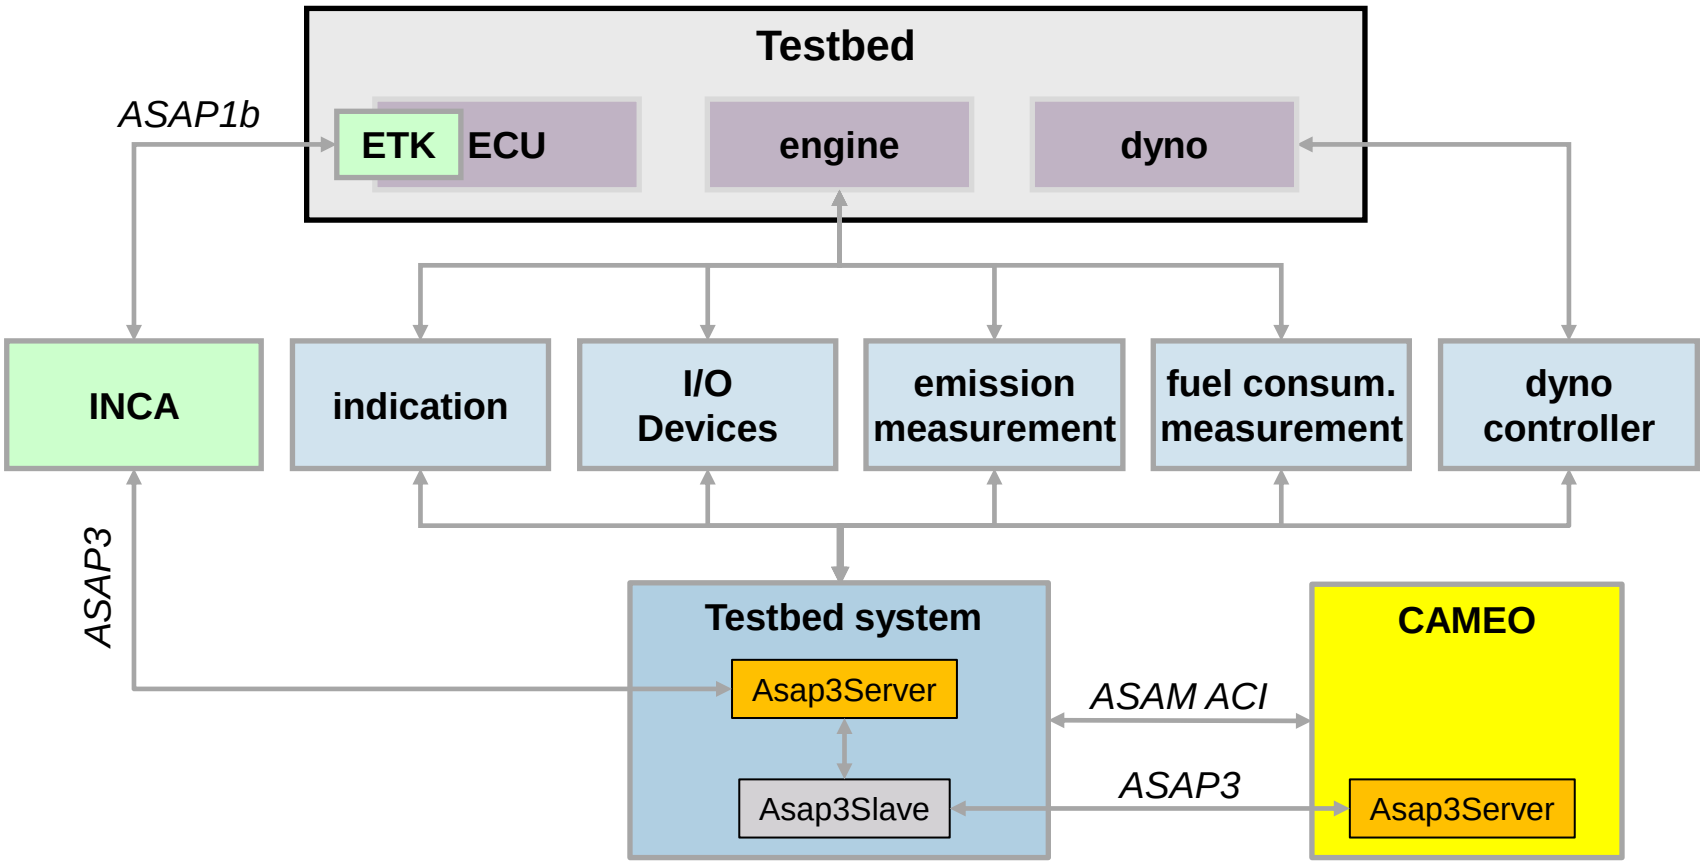
→ *Build up of methodical competence*

→ *Establishment of the technical requirements to maximize the level of automation with the measurement*

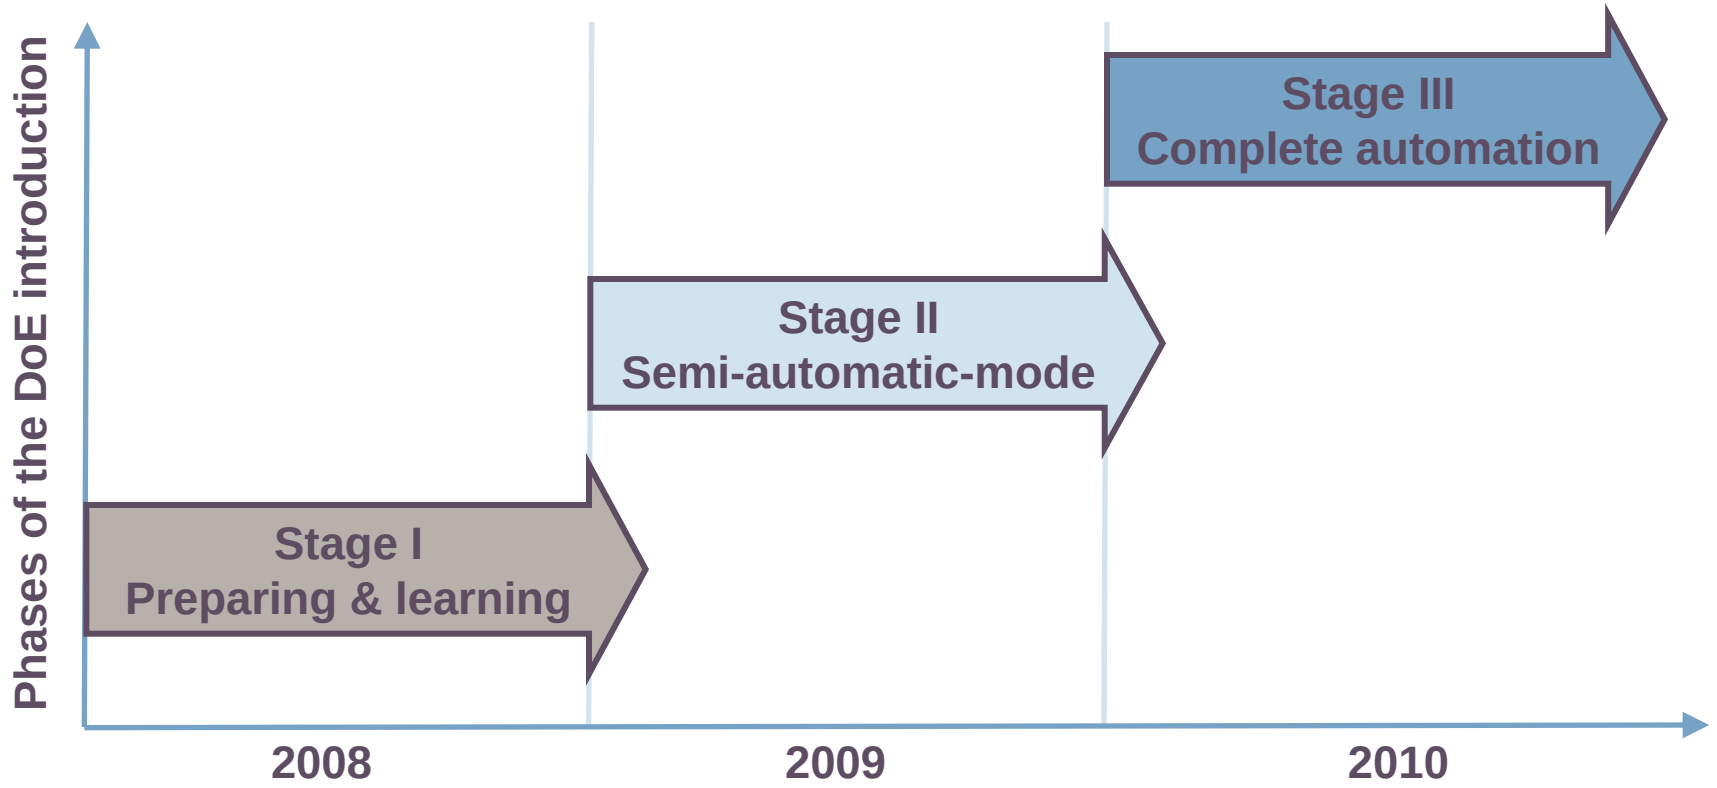
Methodology
Which infrastructure is required?



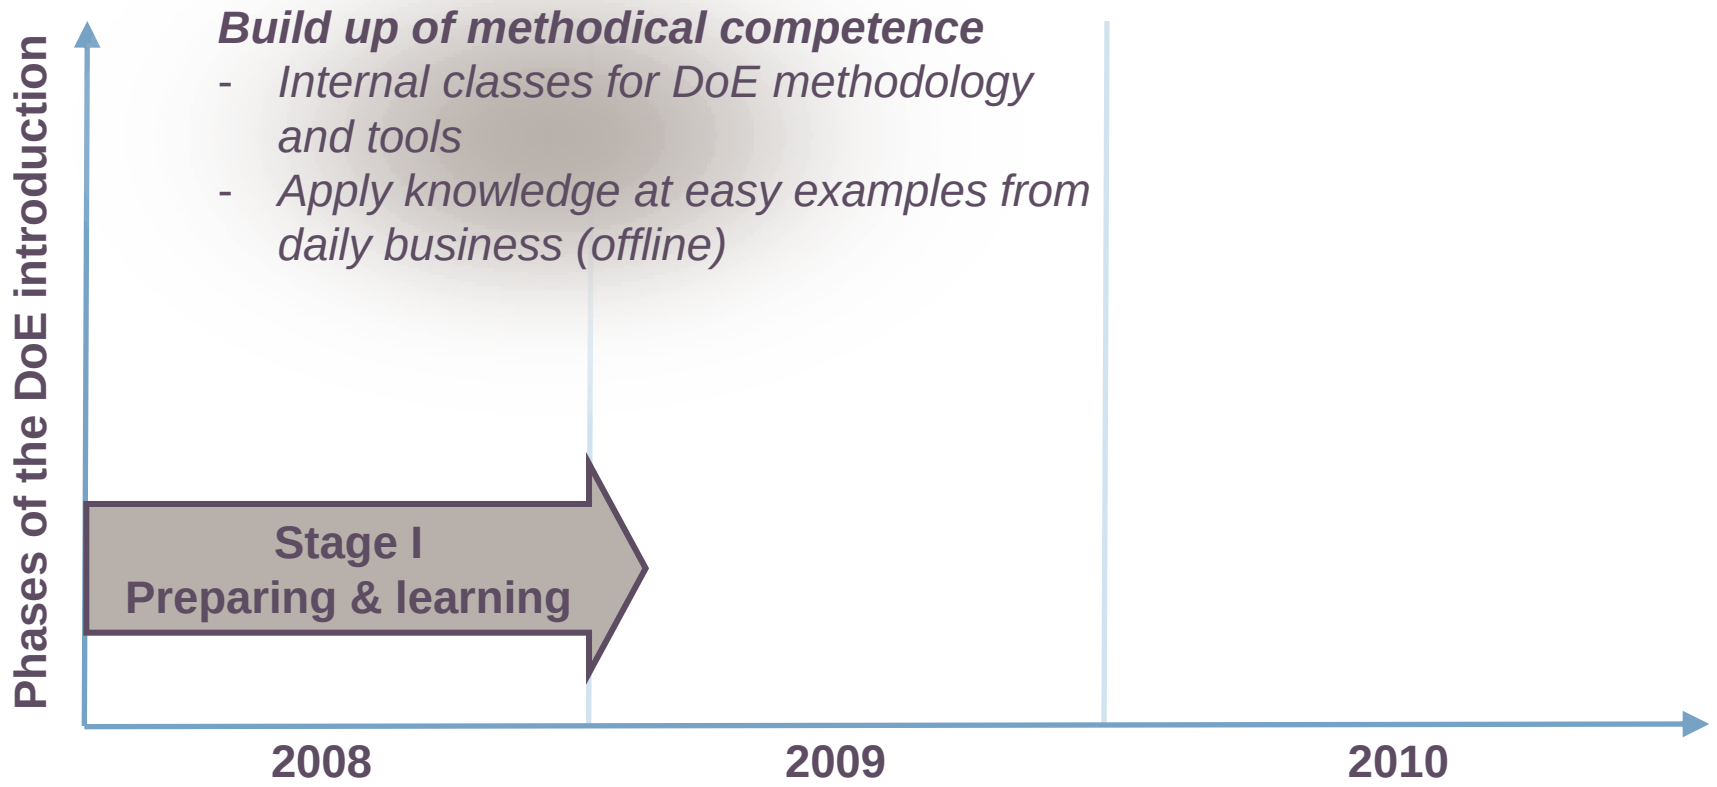
Methodology
Which infrastructure is required?



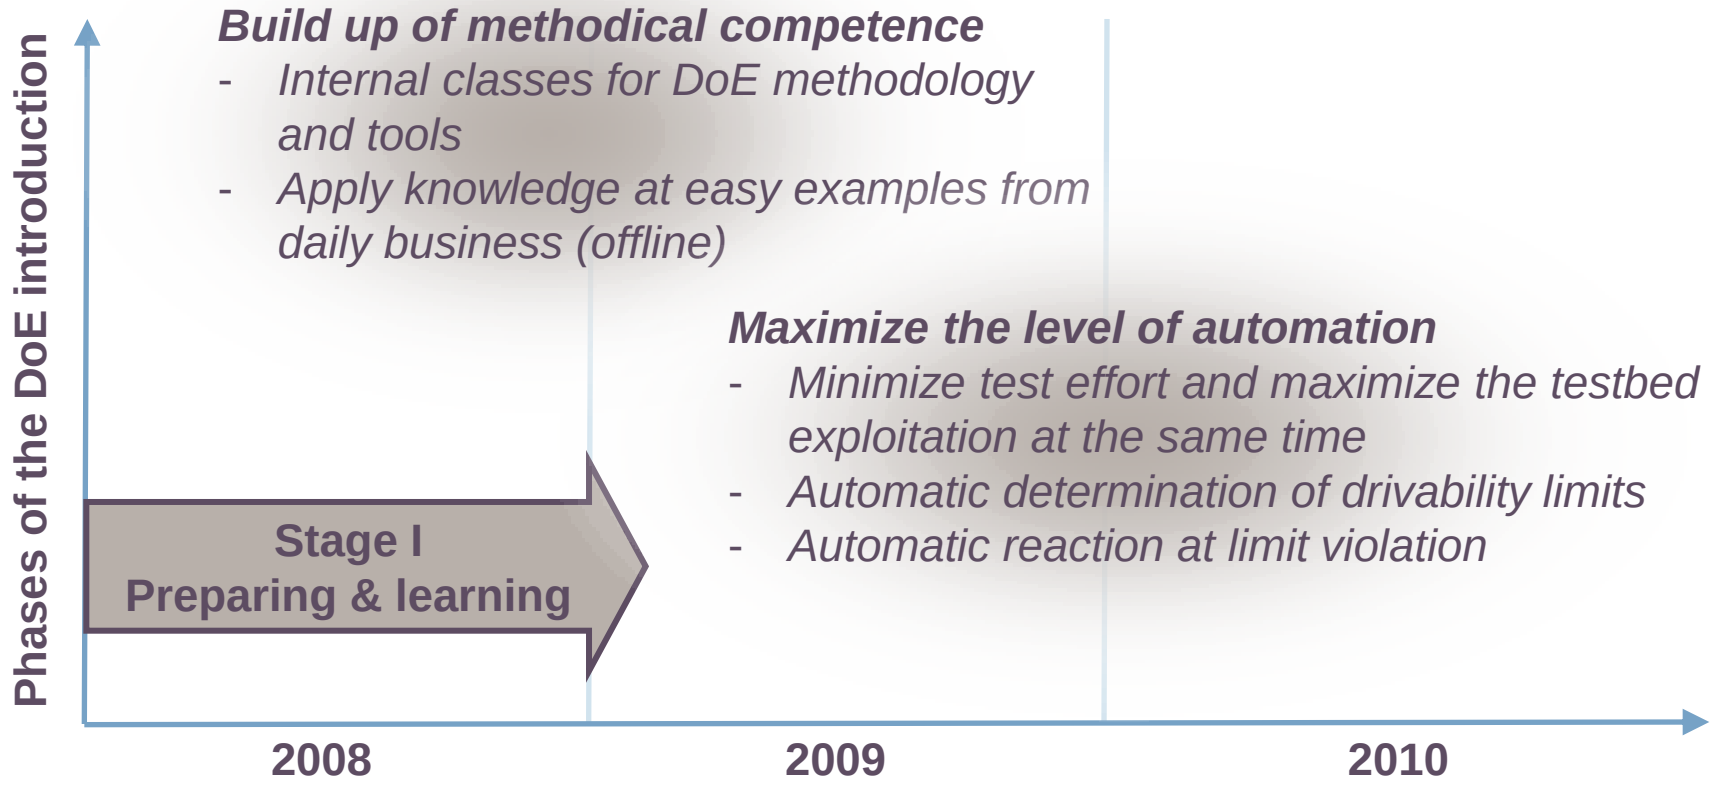
Introduction of DoE and CAMEO



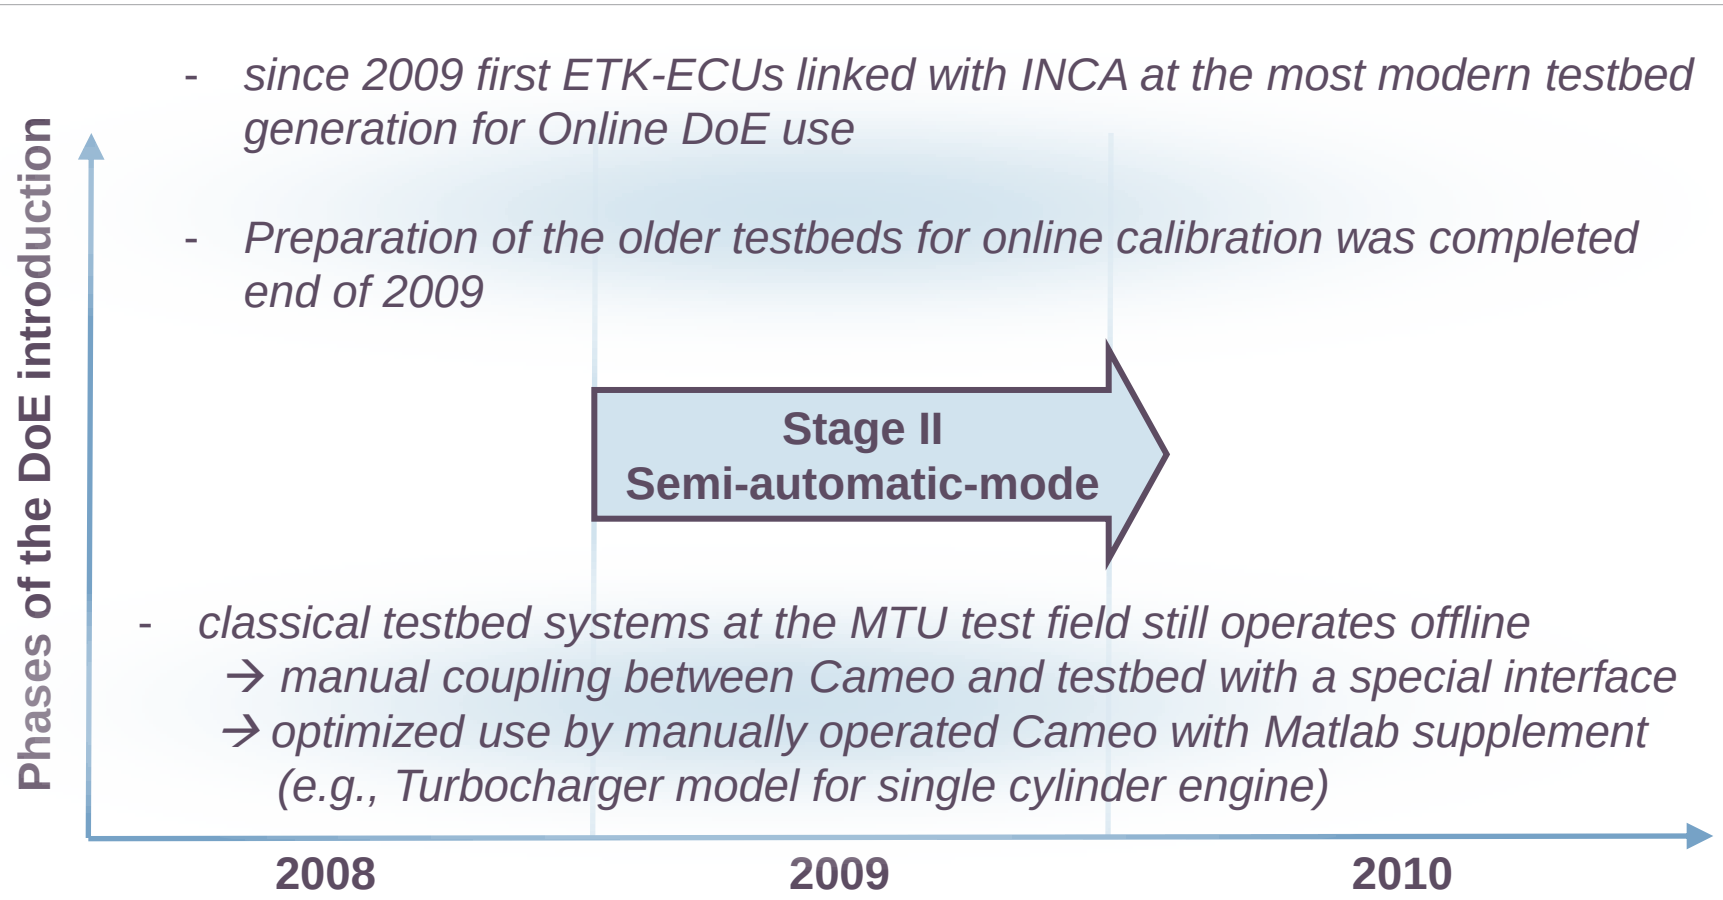
Introduction of DoE and CAMEO



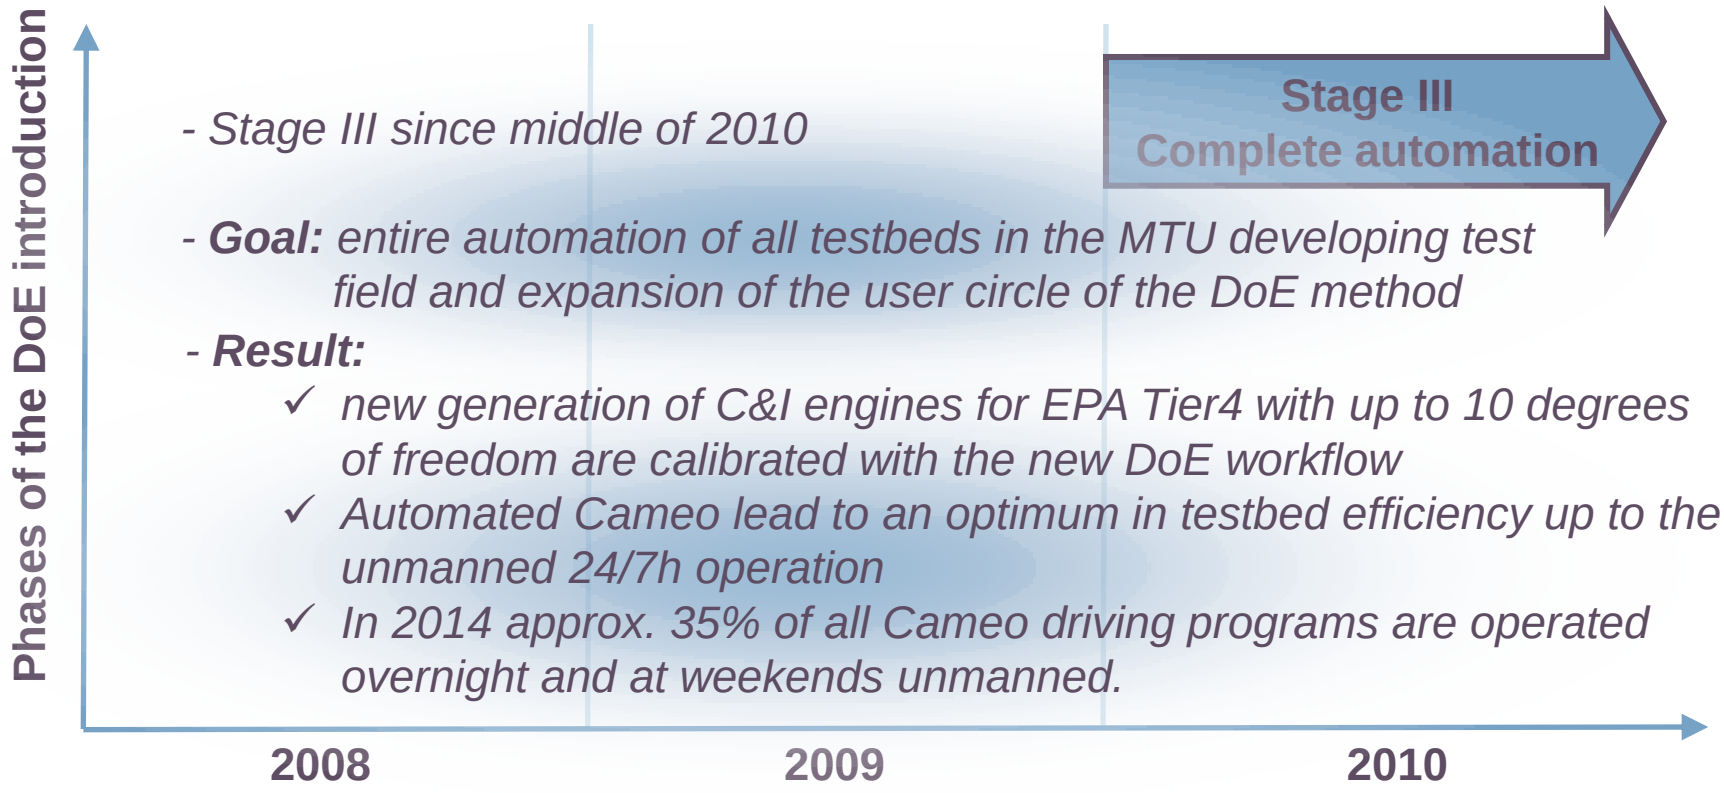
Introduction of DoE and CAMEO



Introduction of DoE and CAMEO



Introduction of DoE and CAMEO



Use and improvement of CAMEO

Cameo as part of the daily calibration and automation business

- *increasing acceptance → use of Cameo increases*
- *Increasing knowledge → higher demands for the driving programs*
- *Cameo experts → DoE schedule, Driving programs and evaluations*
- *Cameo administration → local databases*

Some Knowledge from the day business

- *While evaluation it was recognized that with some uses the expected optima lay beyond the measured test rooms*
- *the use of local databases often complicated the access to existing driving programs*
- *There are special tasks, which cannot be realized with Cameo standard functions*

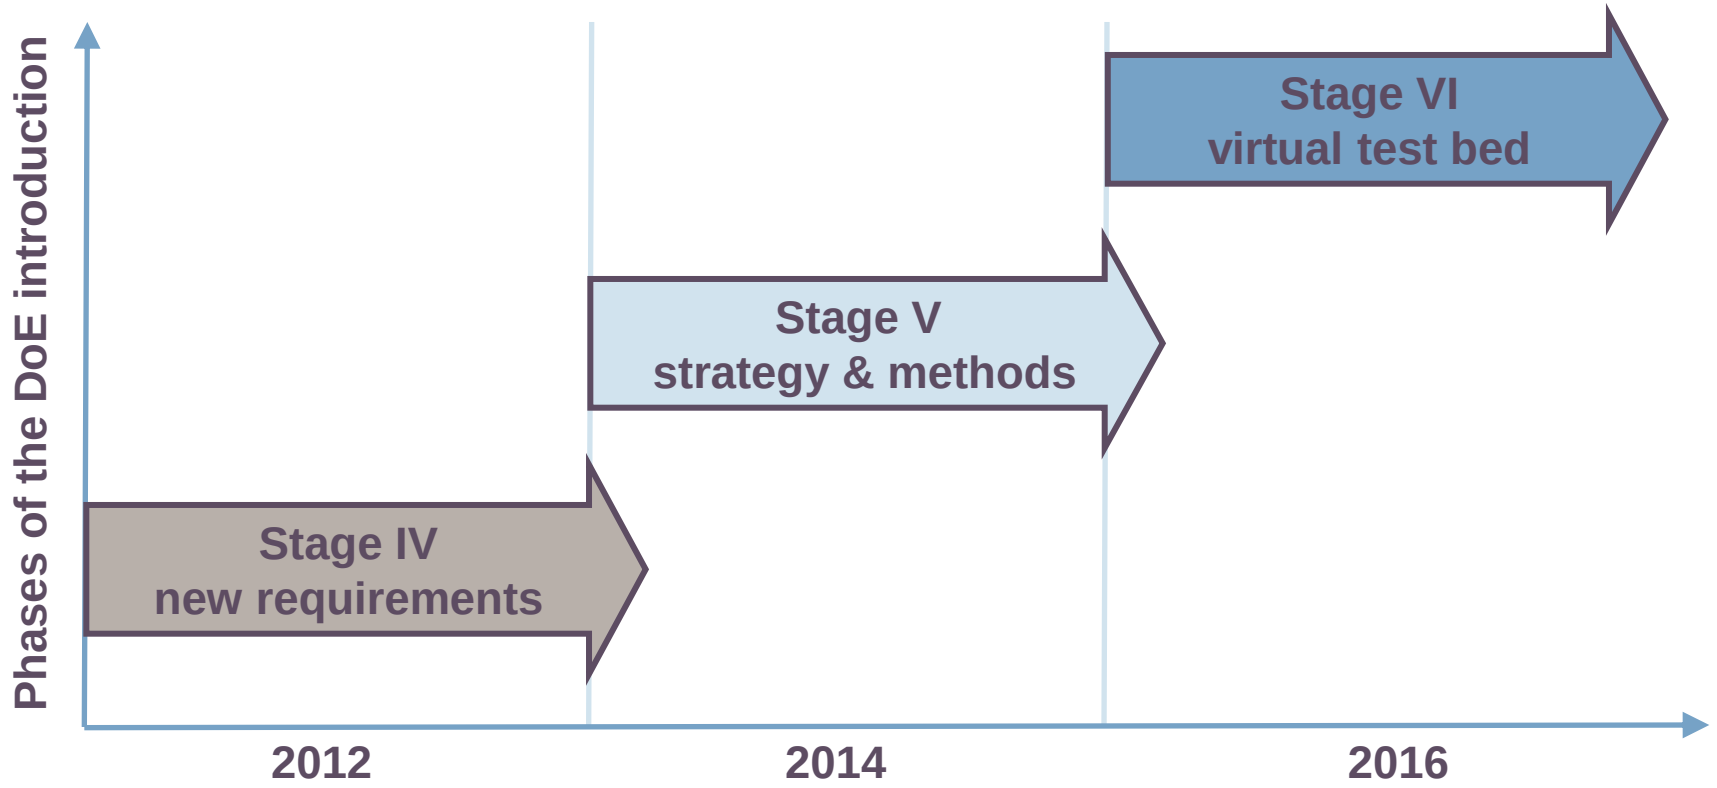
Use and improvement of CAMEO

Everything can be still made better than it is!!!

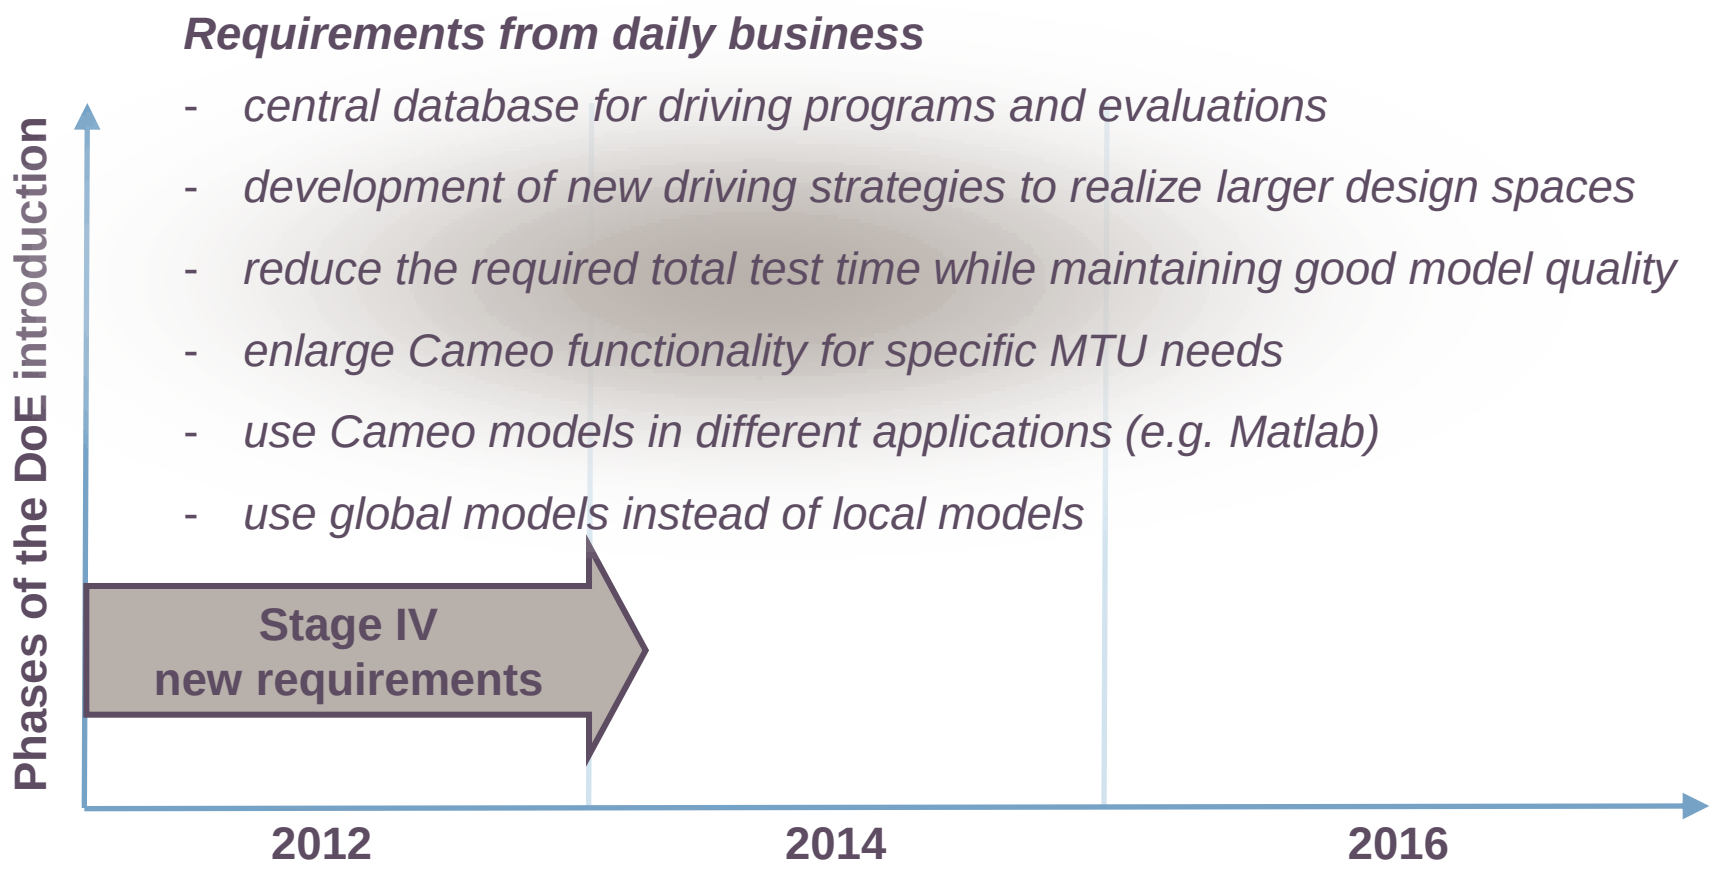
- *find out what works fine, what not*
- *find optimization potential for*
  - *test program management and administration*
  - *larger design spaces*
- *are there tasks which cannot covered with standard Cameo?*

→ Improve Cameo and DoE for special MTU tasks.

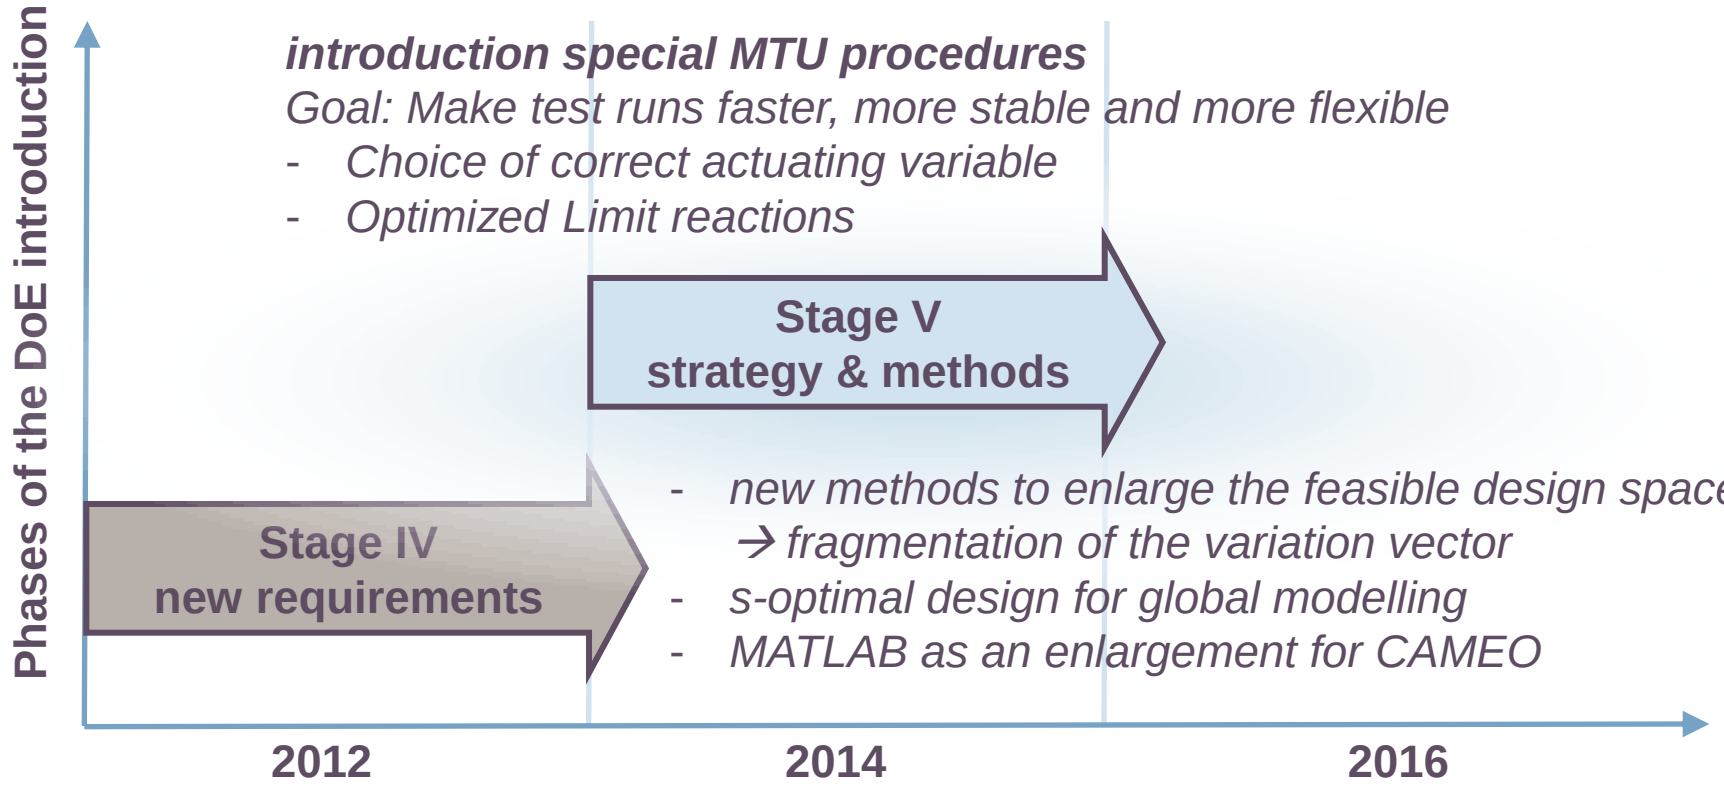
Use and improvement of CAMEO



Use and improvement of CAMEO

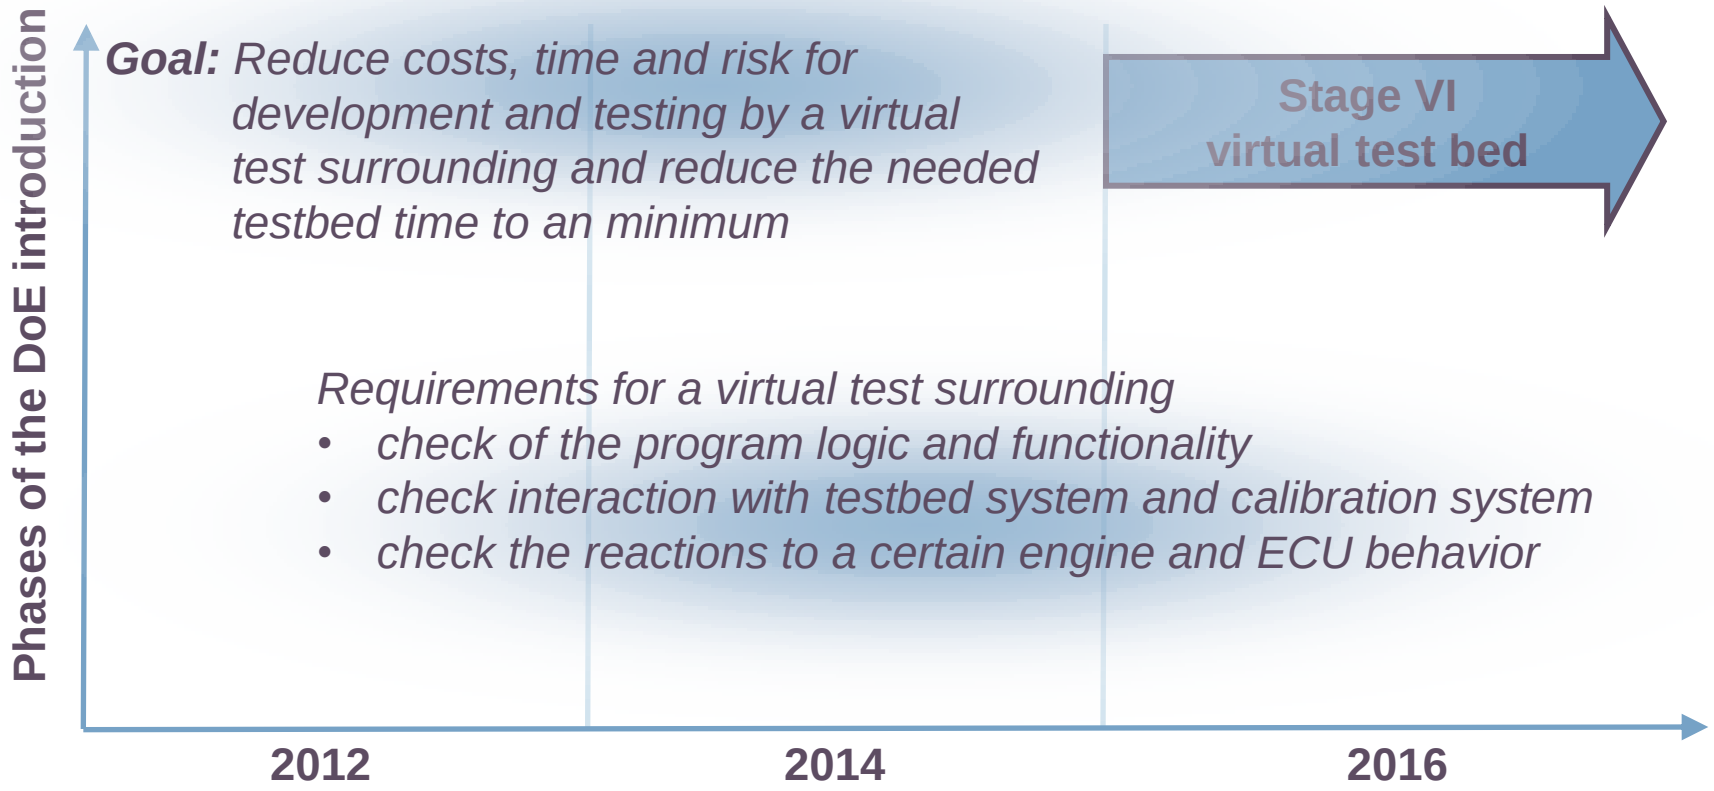


Use and improvement of CAMEO



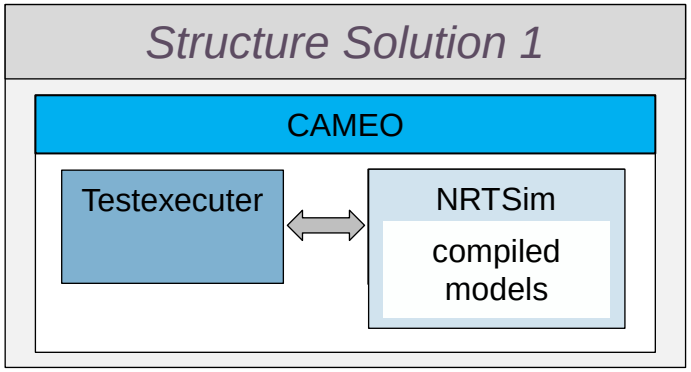
Use and improvement of CAMEO

Separate development and test of new strategies or methods from the testbed



Virtual test surrounding
Solution 1

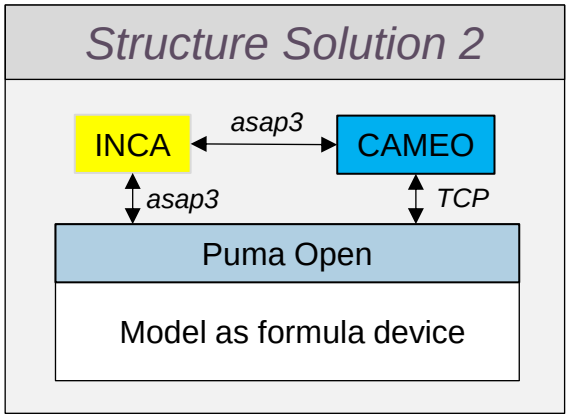
To evaluate easy driving programs, strategies and functionality during Cameo runtime, easy data models (local or global) can be used to represent the engine behavior



- *With NRTSIM or iDoE models from Matlab-Simulink can be provided and use with Cameo during runtime*
- *Usually existing Cameo models are used*
- *The models must be compiled in Matlab accordingly*
- *To provide the compiled Simulink models Matlab realtime workshop is required*

Virtual test surrounding
Solution 2

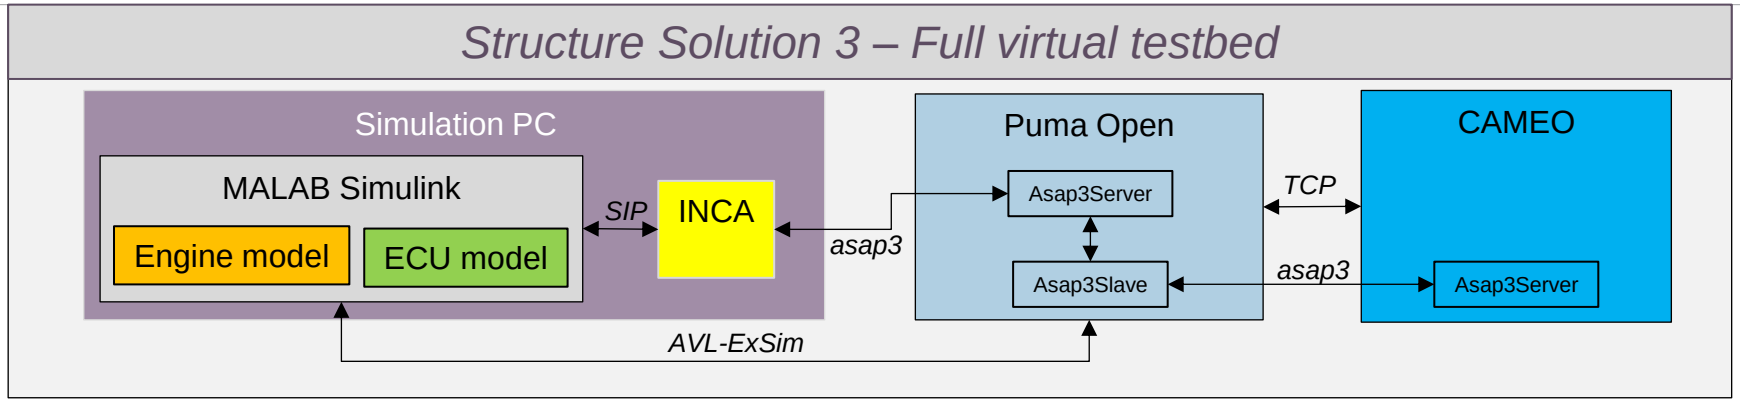
For the evaluation of more complexe applications which do not need ECU response during Cameo runtime, we also can use easy data models as "engine model"



- *With the formula device or with ArteLab models can be provided to the Puma-Simulator and use with Cameo during runtime*
- *Usually existing Cameo polynomial models are used*
- *For ArteLab the models must be compiled in Matlab accordingly*
- *To provide the compiled Simulink models Matlab realtime workshop is required*

For the evaluation of driving programs with direct interaction to the testbed system, this kind of virtual test surroundings is at least necessary.

Virtual test surrounding
Full virtual testbed



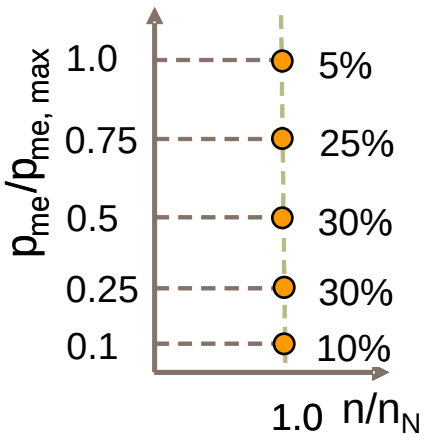
- *Engine and ECU model is performed at a special simulation PC in Simulink during Cameo runtime*
- *The communication between ECU and INCA needs INCA-SIP Interface*
- *The communication between Engine and Puma needs ExSim-Interface*

If we need the real engine and ECU behavior during Cameo runtime this kind of test surrounding is needed for evaluation

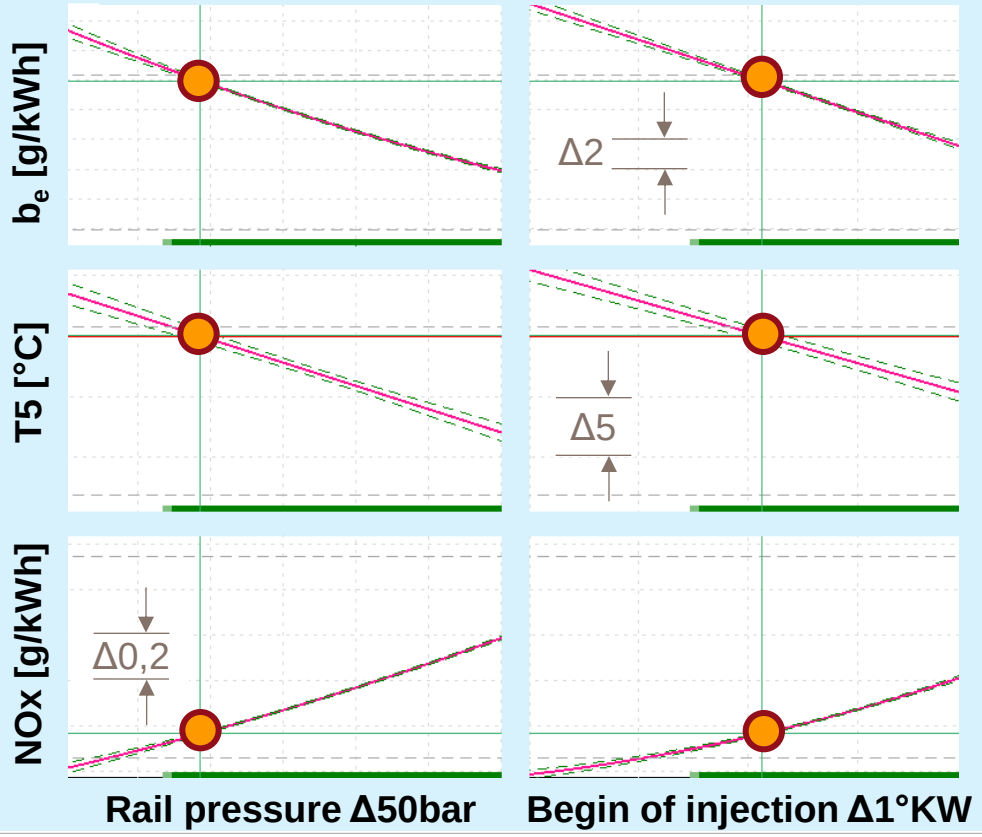
→ *Direct transferability of the Simulation to the testbed*

Example & Results
Comparison of variants with different local restrictions

ISO 8178-4 D2 cycle

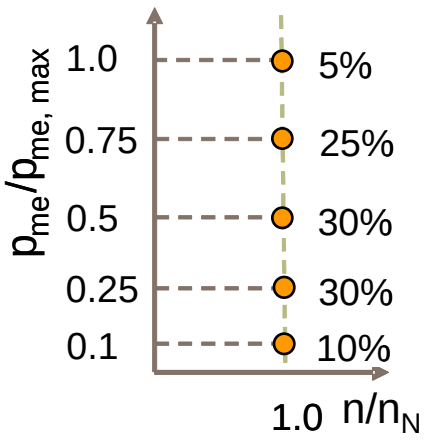


Operatingpoint D2_1 (100% pme)

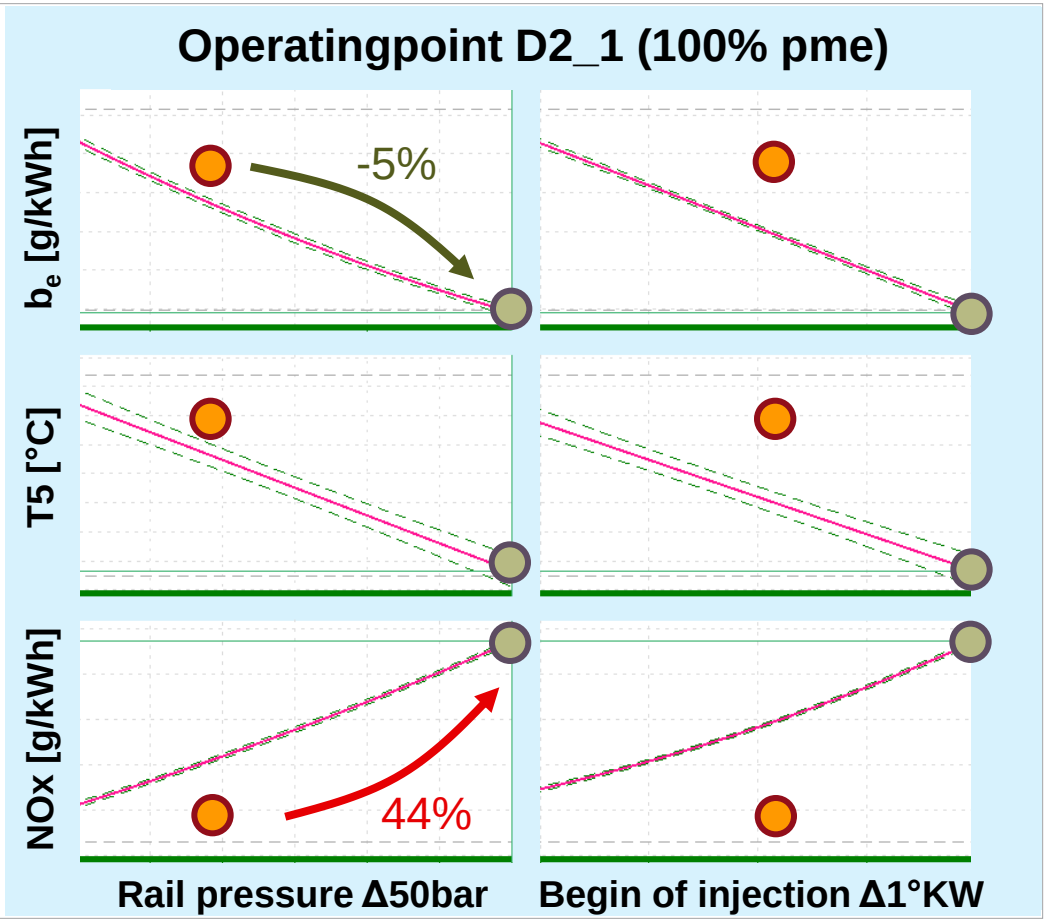


Example & Results
Comparison of variants with different local restrictions

ISO 8178-4 D2 cycle



Effect of decreasing charge air temperature by 10% in the full load point during D2 cycle optimization



Example & Results
Comparison of variants with different local restrictions

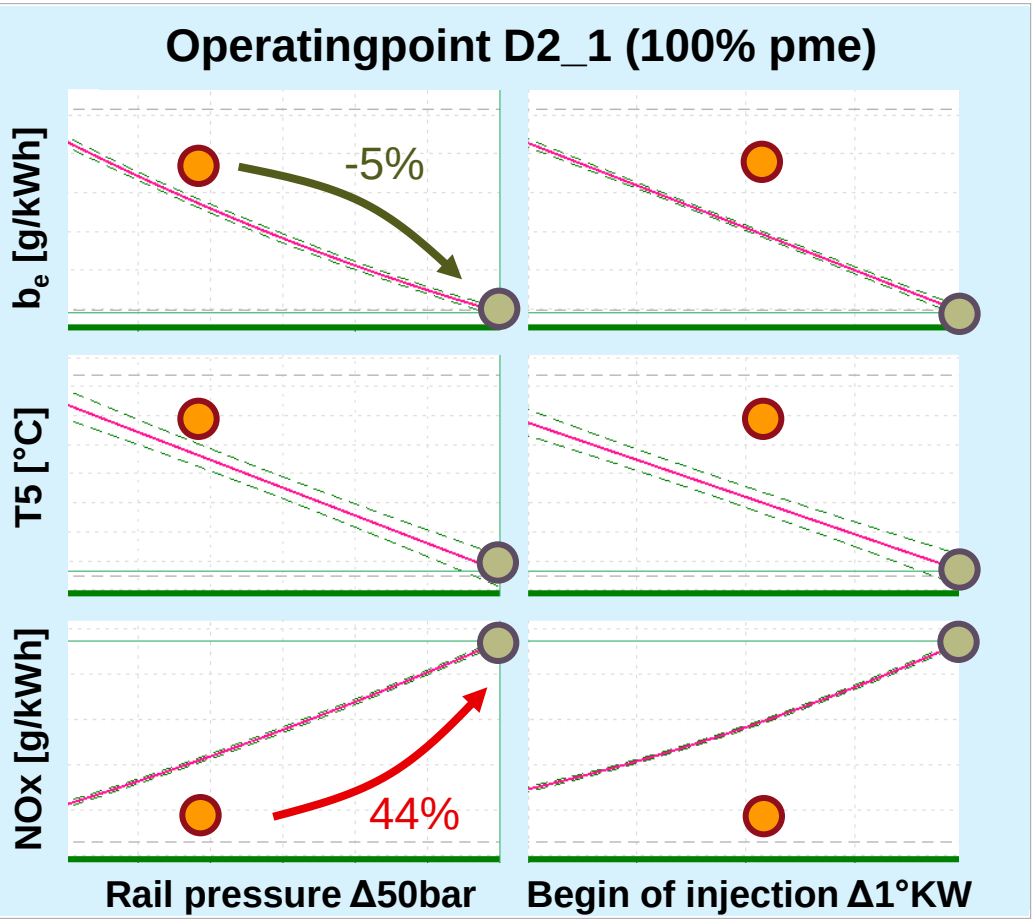
ISO 8178-4 D2 cycle

pme	SB	Rail	NOx	b_e
100	-18	-17	44 ↑	5 ↓
75	30	0	5 ↓	2 ↑
50	0	7	7 ↓	2 ↑
25	-87	4	28 ↓	8 ↑
10	19	-8	7 ↑	0

percentage quotation

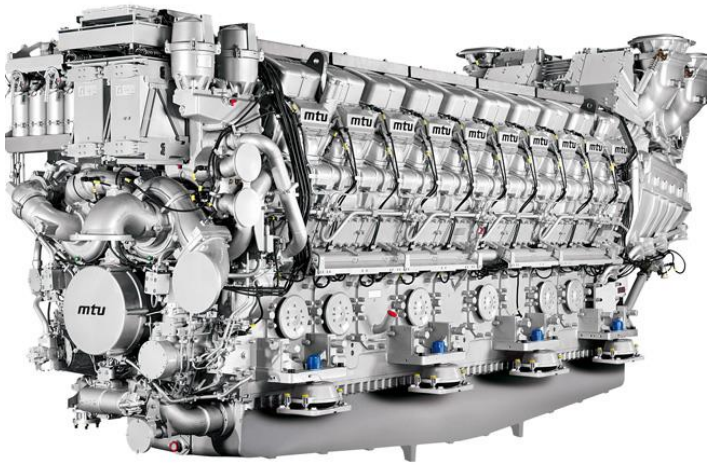
D2 cycle optimisation

b_e	**-3%**
NOx	**±0%**
HC	**-2%**
PM	**-13%**



Example - Stage II
IMO-cycle optimisation at 20VBR8000M71L

- IMO certification by EPA for E2-cycle (generator curve) and the E3-cycle (propeller curve)
- each cycle is built up of 4 operating points at which the full load point is same for both cycles and must be measured, hence, only once.
- Measuring time per operating point ≈ 3 to 4h | B_H ≈ 1720kg/h ≈ 2020l/h (b_e ≈ 189g/kWh)



→ the DoE method approx. saved 15 hours of testing compared with the conventional “hand made” calibration.

→ With a consumption of approx. 2000l/h arises a saving potential of approx. 30000€

Summary
→ Application of Methodology!

The increase of the legislation leads to more degrees of freedom and a higher application expenditure

- ***Application of Methodology → Control of the complexity***
- ***Automation→ Optimization of the test bed capacity***

The introduction and optimization of the automation with the measurement requires interventions in the ECU and in the test bed (realized in 1.5 years!!!)

Model-based approach delivers many advantages, as for example

- ***by the cycle calibration,***
- ***map calibration for different applications***

Virtual test bed

→ Cost-effective development and testing of driving programs and strategies

New ways demand new methods!
