Documentation

The GH15DK has the slimmest contour due to a M3 cable connector and is an accurate and robust M5 sensor especially suited for supercharged engines with high specific output. It has thermally optimized piezoelectric crystal elements and the special Double Shell™ design. It decouples the piezoelectric elements from negative influences of mechanical stresses which can occur due to the mounting of the sensor into the engine. Additionally it has an improved membrane material and geometry. This makes the sensor more robust suitable as the standard solution for research and development work with perfect trade off between accuracy and robustness. Using a thermo protection like PH08 can improve the cyclic drift by 0.4 bar. The sensor is equipped with built in SID for SDM.

Icons of strength / Measurement Task

Toughness / knock applications Purpose: Specially designed to with-stand under extreme and harsh conditions

Examples: Analysis of knocking combustion, operation under high engine loads, supercharged engines.

Today, GaPO4 is by far the best suited piezo-electric material to be used in sensor applica-tions. It has a combination of several unique properties that make it the first choice.

Precision / thermodynamic analysis Examples: Measurements for heat Purpose: Very highly accurate measurements for critical thermodynamic analysis.

release and friction loss calculations

Double Shell™ Due to their high sensitivity, these elements are Mechanically decouples the crystals from the housing for premium signal quality.

Due to their high sensitivity, these elements are also susceptible to any other kind of applied pressure which would else cause a misreading of the combustion pressure
